

Programming for Economist

Intro to Exercise classes
Class 3

Matias B.F. Hall,
Institute of Economics,
September 2026

KØBENHAVNS UNIVERSITET

Agenda for today

1. Why is this course relevant? Why participate?
2. Who am I?
3. Who are you? Expectations
4. Practicalities
5. Installations, setup, problem set 1 and DataCamp

1. Why learn Python?

1. Python is a super versatile program that can be used to solve various economic problems.
 - Data handling
 - Numerical solutions
 - Simulations
 - Automation
2. Python can help bridge the gap between theory and practice.
 - Builds on your math knowledge and let's you work on more realistic economic models
3. Many courses later on uses Python as well as many workplaces.
4. You have an Exam

1. Why participate actively?

1. Python/programming is like solving puzzles – it can be fun to create and solve models.
2. Learning programming/Python is hands on
 - Working actively will help you understand both code and economics better.
 - Focus is not on memorisation but understanding concepts.
 - Relying too heavily on AI, will not lead to problems in this course, but will inhibit your ability to learn, and will give you problems with more complex coding that AI cannot (yet) do that you will meet later on.
3. The more you participate the more help and feedback you get.

2. Who am I?

- Matias Hall
- MSc in Economics 2024
 - Main interests: Dynamic models/programming, micro founded macroeconomics and econometrics
 - Was an active member of Kritiske Politter
- Currently working in the economics office of Christiania
- I taught a handful of 1st and 2nd year courses while studying.
- Why I teach ProgEcon:
 - I really enjoy programming in Python and the tools it offers.
 - I think teaching is both fun and rewarding
- Contact: matias.hall@econ.ku.dk

3. Who are you?

Exercise to get to know each other:

- Take 2-3 minutes to discuss:
 - What semester are you on?
 - What is your programming experience(Python/other languages)
 - What motivated you to take this course?
 - What are your expectations from this course
- Pick one from your table/group to present what you discussed – keep it short.
- I will ask/learn your names as I come around and help while you work.

4. Practicalities

- **Calendar:** <https://sites.google.com/view/numeconcph-progecon/calendar>
- **Exercise classes:**
 - 14 x 3 hours
 - Short intro to the most important topics of today, and some hints for today's PS.
 - Then you will work on your own, and I'll come around to help
- **Deadlines:**
 - All must be completed on time to qualify for the exam.
 - **DataCamp** – one each Sunday until 11th October
 - **Data project** – 29th November
 - **Model project** – 13th December
 - Approved projects does not mean a pass at the Exam, but you will have time to improve it. You are allowed to hand in projects in groups of 4.
- **Exam:** Some time in January
 - 40% revised projects and 60% 36 hour take home – Pass/fail

4. Practicalities

My solutions and slides are posted here:

<https://github.com/Matias-BF-Hall/ProgEcon-exclass>

My expectations:

- That you follow lectures and know the curriculum.
- You are ready when class begins and participate actively.
- You ask lots of questions – no bad questions!
- And that we'll have not only exciting but also enjoyable and cosy classes together 😊
- I can also make mistakes
 - Please say if you believe I made a mistake/said something wrong
 - I don't know everything by heart, but also actively use documentation and LLM's when I code.
 - Feedback is very welcome so we can improve classes together

5. Installations - Checklist

1. Login to [DataCamp](#)
2. Install Anaconda(Python) and VSCode
3. Download slides and exercises
4. Run code from the first lecture
5. Apply for [GitHub Education](#)

Later on in the course we will look at Git and Github. If you are already interested, come and ask me :)

Hints for Problem Set 1

- In Python, when counting a sequence of integers from 0 to n , the count starts at 0 but stops at $n-1$, i.e., not including n itself.
- When indexing/slicing use `list_name[i,k]` Where i is included and k is excluded.
- Given that x is a list, `x[-1]` accesses the last element in the list.
